

Abstract

Embodiments of the data transmission management system are directed to a system which confirms transmission requests from users and identifies the user's geographical region. Embodiments of the data transmission management system comprise a storage member, a confirmation system and a re-direct system, wherein the confirmation system confirms a user's request for data and identifies the user's geographical region, and wherein the re-direct system selects and transmits suitable data for that region. The data transmission management system further operates in conjunction with an animated module utilized to ascertain payment data, wherein the animated module visually depicts the desired information from the user.
